AEM Training - Day 7 Assignment (26-03-2025)

1. Create SampleServlet Extending SlingAllMethodsServlet

Description:

Create an AEM servlet that is registered using resourceType. This servlet will handle HTTP GET requests and log the execution.

Code Snippet (SampleServlet.java):

```
@Component(service = Servlet.class, property = {
    "sling.servlet.resourceTypes=myapp/components/page",
    "sling.servlet.methods=GET"
})
public class SampleServlet extends SlingAllMethodsServlet {
    private static final Logger LOG = LoggerFactory.getLogger(SampleServlet.class);

    @Override
    protected void doGet(SlingHttpServletRequest request, SlingHttpServletResponse response) throws ServletException, IOException {
        response.getWriter().write("Sample Servlet Executed");
        LOG.info("Sample Servlet Executed");
    }
}
```

2. Create CreatePageServlet Extending SlingSafeMethodsServlet

Description:

This servlet is registered using a specific path and is designed to create pages based on user input.

Code Snippet (CreatePageServlet.java):

```
@Component(service = Servlet.class, property = {
    "sling.servlet.paths=/bin/createPage",
    "sling.servlet.methods=POST"
})
public class CreatePageServlet extends SlingSafeMethodsServlet {
    @Reference
    private ResourceResolverFactory resolverFactory;

    @Override
    protected void doPost(SlingHttpServletRequest request, SlingHttpServletResponse response)
throws ServletException, IOException {
        String pageName = request.getParameter("pageName");
        try (ResourceResolver resolver = resolverFactory.getServiceResourceResolver(null)) {
            PageManager pageManager = resolver.adaptTo(PageManager.class);
            if (pageManager != null) {
                Page newPage = pageManager.create("/content/mysite", pageName,
"/apps/myapp/templates/page", pageName);
                resolver.commit();
                response.getWriter().write("Page created successfully: " + newPage.getPath());
            } else {
                response.getWriter().write("PageManager is null");
            }
        } catch (PersistenceException e) {
            response.getWriter().write("Page creation failed: " + e.getMessage());
        }
    }
}
```

---

3. Use PageManager API to Create Pages

Description:
This servlet demonstrates how to dynamically create pages using the PageManager API.

Steps:

1. Retrieve the PageManager instance from the ResourceResolver.
2. Call the create() method, passing the parent path, page name, template path, and title.
3. Commit the changes using resolver.commit().

Code Snippet:

```
PageManager pageManager = resolver.adaptTo(PageManager.class);
if (pageManager != null) {
    Page newPage = pageManager.create("/content/mysite", pageName, "/apps/myapp/templates/page", pageName);
    resolver.commit();
}
```

---

4. Create SearchServlet Using PredicateMap

Description:
This AEM servlet allows you to search for content using the QueryBuilder API and a PredicateMap.

Code Snippet (SearchServlet.java):

```
@Component(service = Servlet.class, property = {
    "sling.servlet.paths=/bin/searchContent",
    "sling.servlet.methods=GET"
})
public class SearchServlet extends SlingSafeMethodsServlet {
    @Reference
    private QueryBuilder queryBuilder;
    @Override
    protected void doGet(SlingHttpServletRequest request, SlingHttpServletResponse response) throws ServletException, IOException {
        Map<String, String> map = new HashMap<>();
        map.put("path", "/content/mysite");
        map.put("type", "cq:Page");
        map.put("p.limit", "-1");
        Query query = queryBuilder.createQuery(PredicateGroup.create(map), request.getResourceResolver().adaptTo(Session.class));
        SearchResult result = query.getResult();
        for (Hit hit : result.getHits()) {
            response.getWriter().write(hit.getPath() + "\n");
        }
    }
}
```
